

School of Computer Science and Engineering

Winter Semester 2023-24

Continuous Assessment Test – I

SLOT: E2 + TE2

Programme Name & Branch: B. Tech CSE

Course Name & Code: Cryptography and Network Security – BCSE309L

Class Number (s): Applicable to All

Faculty Name (s): Prof. S. Ramani

Exam Duration: 90 Min.

Maximum Marks: 50

General instruction(s):

Answer all the Questions.

Tables related to DES/AES are given in the question paper.

Q. No.	Question	Max Marks
1.	a) Find the greatest common divisor d of 412 and 54, and find integers x and y solving the equation $412x + 54y = d$. Ans: $d = 2$. The extended Euclidean algorithm gives $x = 8$ and $y = -61$. (There are other solutions for x and y ; these are not unique.) b) Solve the congruence $X^{103} \equiv 4 \pmod{11}$ to find the value of X using Fermat's theorem. Ans: By Fermat's Little Theorem, $x^{10} \equiv 1 \pmod{11}$. Thus, $x^{103} \equiv x^3 \pmod{11}$. So, we only need to solve $x^3 \equiv 4 \pmod{11}$. If we try all the values from $x = 1$ through $x = 10$, we find that $5^3 \equiv 4 \pmod{11}$. Thus, $x \equiv 5 \pmod{11}$.	5 5
2.	a) Solve the given congruence equations to obtain the value of x $x \equiv 2 \pmod{5}$ $x \equiv 3 \pmod{7}$ $x \equiv 10 \pmod{11}$ Ans: $x \equiv 87 \pmod{385}$ b) Find $\phi(1200)$ Ans. 320	8 2
3.	a) Solve $7^{106} \pmod{143}$ using fast modular exponentiation	5 5

	<p>106 = 1101010 in binary</p> $106 = 2^1 + 2^3 + 2^5 + 2^6$ $106 = 2 + 8 + 32 + 64$ $7^{106} \bmod 143 = 7^{(2+8+32+64)} \bmod 143$ $7^{106} \bmod 143 = (7^2 \cdot 7^8 \cdot 7^{32} \cdot 7^{64}) \bmod 143$ <p>Step 2: Calculate mod C of the powers of two <= B</p> $7^1 \bmod 143 = 7 \bmod 143 = 7$ $7^2 \bmod 143 = (7^1 \cdot 7^1) \bmod 143 = (7^1 \bmod 143 \cdot 7^1 \bmod 143) \bmod 143 = (7 \cdot 7) \bmod 143 = 49 \bmod 143 = 49$ $7^4 \bmod 143 = (7^2 \cdot 7^2) \bmod 143 = (7^2 \bmod 143 \cdot 7^2 \bmod 143) \bmod 143 = (49 \cdot 49) \bmod 143 = 2401 \bmod 143 = 113$ $7^8 \bmod 143 = (7^4 \cdot 7^4) \bmod 143 = (7^4 \bmod 143 \cdot 7^4 \bmod 143) \bmod 143 = (113 \cdot 113) \bmod 143 = 12769 \bmod 143 = 42$ $7^{16} \bmod 143 = (7^8 \cdot 7^8) \bmod 143 = (7^8 \bmod 143 \cdot 7^8 \bmod 143) \bmod 143 = (42 \cdot 42) \bmod 143 = 1764 \bmod 143 = 48$ $7^{32} \bmod 143 = (7^{16} \cdot 7^{16}) \bmod 143 = (7^{16} \bmod 143 \cdot 7^{16} \bmod 143) \bmod 143 = (48 \cdot 48) \bmod 143 = 2304 \bmod 143 = 16$ $7^{64} \bmod 143 = (7^{32} \cdot 7^{32}) \bmod 143 = (7^{32} \bmod 143 \cdot 7^{32} \bmod 143) \bmod 143 = (16 \cdot 16) \bmod 143 = 256 \bmod 143 = 113$ <p>Step 3: Use modular multiplication properties to combine the calculated mod C values</p> $7^{106} \bmod 143$ $= (7^2 \cdot 7^8 \cdot 7^{32} \cdot 7^{64}) \bmod 143$ $= (7^2 \bmod 143 \cdot 7^8 \bmod 143 \cdot 7^{32} \bmod 143 \cdot 7^{64} \bmod 143) \bmod 143$ $= (49 \cdot 42 \cdot 16 \cdot 113) \bmod 143$ $= 3720864 \bmod 143$ $= 4$ $\therefore 7^{106} \bmod 143 = 4$ <p>b) Determine all integers in the set $\{1, \dots, 11\}$ that are primitive roots of modulo 11</p> <p>Ans: 2,6,7,8</p>	
4.	<p>a) Differentiate Initialization vector and Nonce in Block cipher modes operations. Explain the reason that you should use block cipher CBC mode instead of block cipher ECB mode.</p> <p>An IV is a nonce with an additional requirement: it must be selected in a nonpredictable way. That is, the IV can't be sequential; it must be random. CBC has the advantage over the ECB mode in that the XORing process hides plaintext patterns. Even if the first plaintext block and third plaintext block were the exact same segment of plaintext, it is highly unlikely that the first ciphertext block and third ciphertext block would be the same.</p>	<p>3</p> <p>7</p>

	<p>b) Discuss primitive operations and key expansion procedure in IDEA and also Explain the steps involved in one round of IDEA to encrypt the plain text.</p> <ul style="list-style-type: none">• Each rounds makes use of 6 subkeys (8X6=48) and the final output transformation uses four subkeys(48+4 =52 subkeys).• 128-bit key is divided into 8 parts K1 to K8 each of 16 bits.• Of which K1 to K6 is used for ROUND 1 operation.• For the remaining round subkeys are generated by performing key shifting.• The original key is shifted left circularly by 25 bits and hence 52 subkeys are generated.• Operations performed are Addition, Multiplication, XOR <p>Each round involves a series of operation on the four data blocks using six keys.</p> <table><tr><td>1.
